Graph Convolutional Neural Network based Depression Detection using Brain Functional Connectivity Measures

Jutika Borah, Debarun Chakraborty, Bhabesh Deka, *Senior Member, IEEE*, Rosy Sarmah, *Member, IEEE*, Siddeswara Bargur Linganna, Diptadhi Mukherjee, Ram Bilas Pachori, *Fellow, IEEE*, and Mohit Khamele

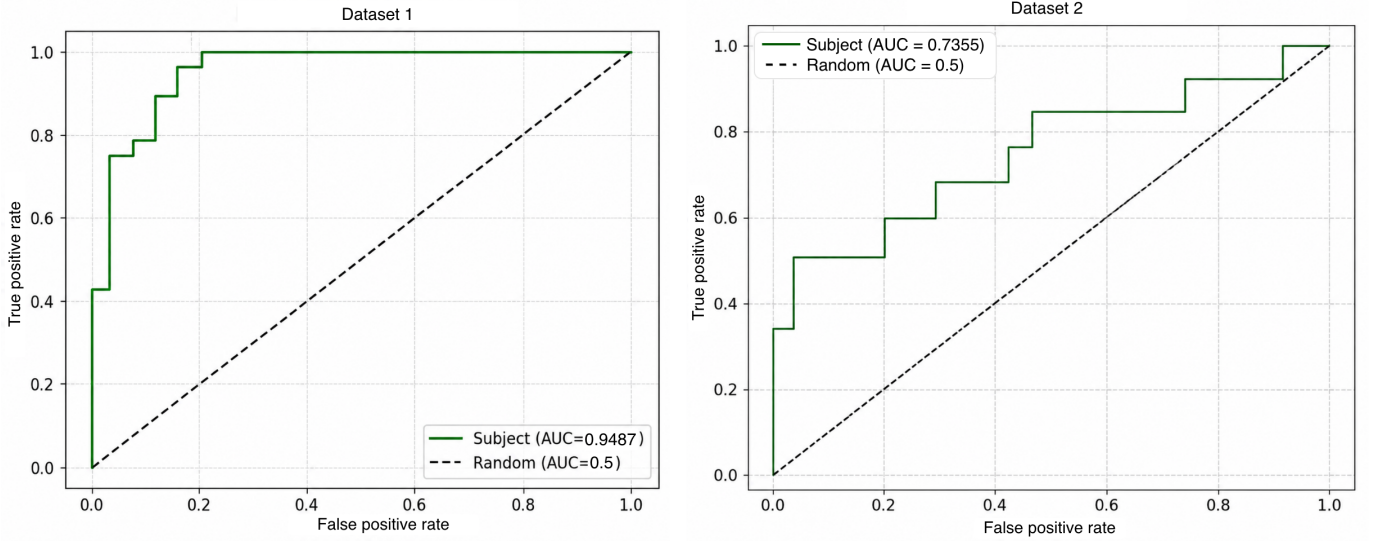

Figure S1: ROC Curve with dataset 1 and dataset 2.

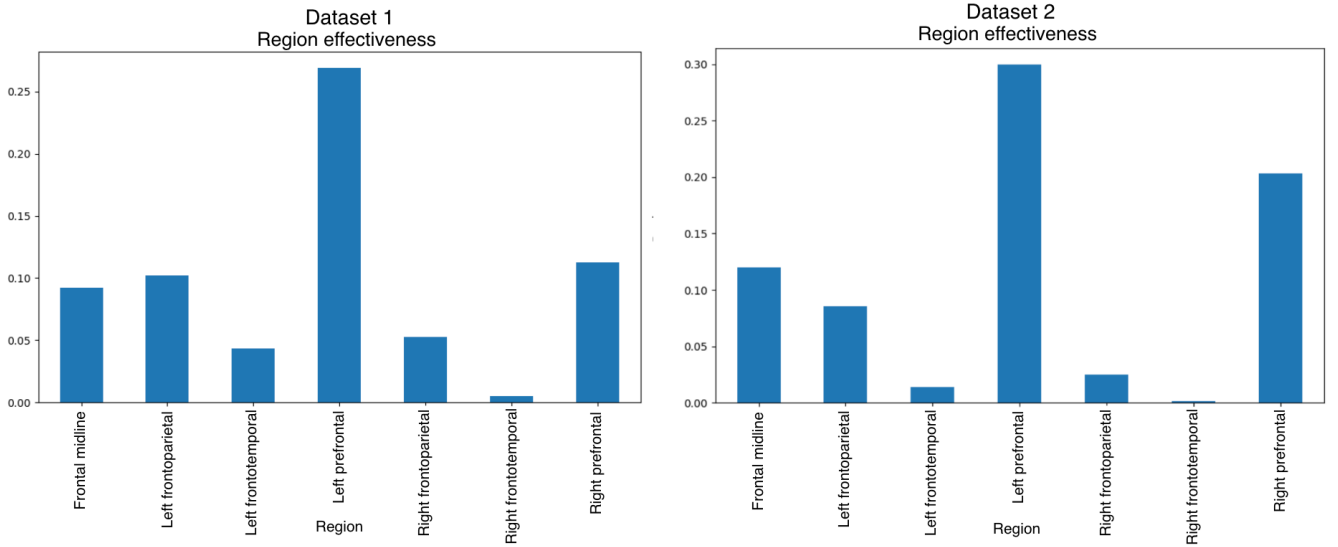

Figure S2: Brain region comparison showing the importance of different regions of the brain with different interconnections and their effectiveness in the MDD use case for dataset 1 and dataset 2.

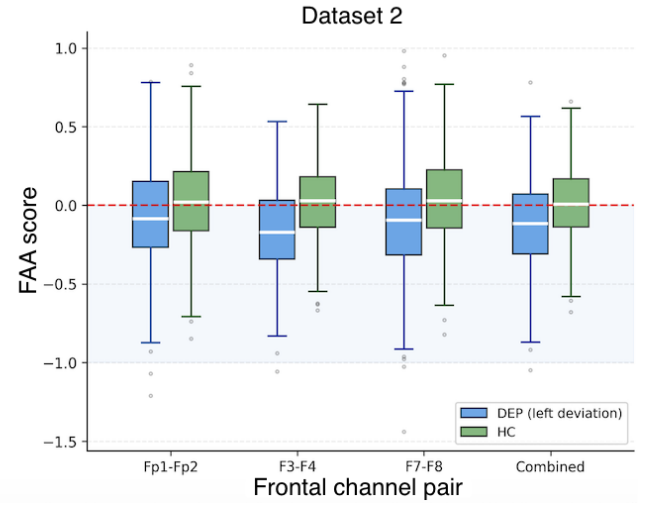

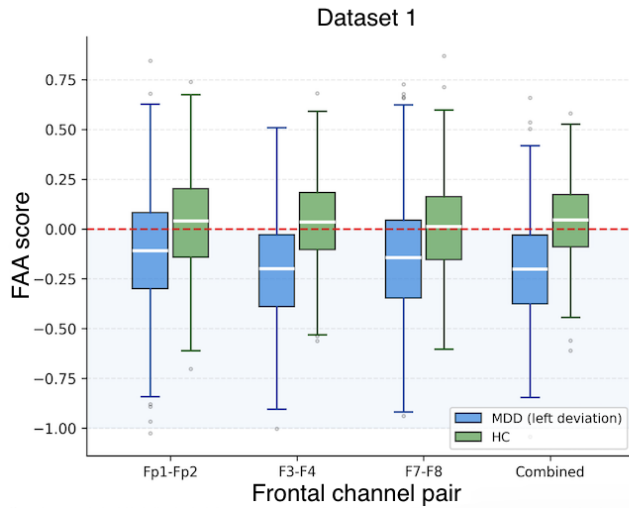

Figure S3: FAA study by channel pair across two datasets.

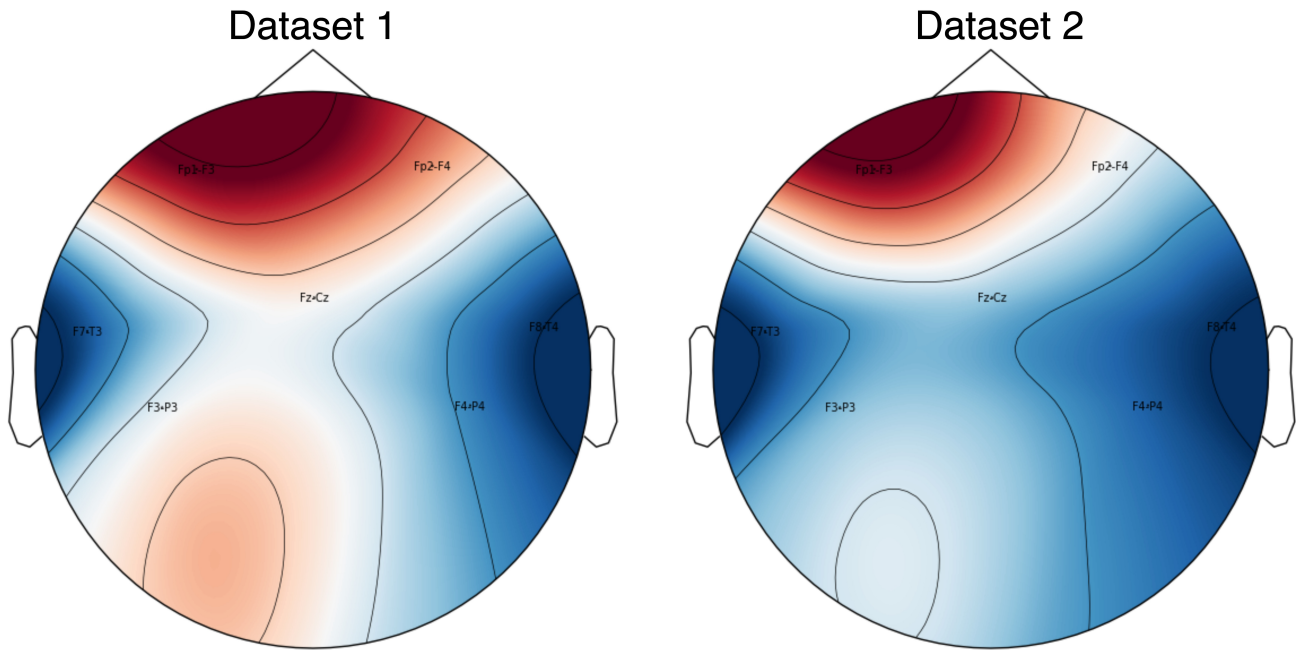

Figure S4: Topographic distribution of EEG activity across bipolar channel pairs. Here, a higher degree of effectiveness is indicated by warmer colors, such as red, while colors such as blue represent lower effectiveness. This demonstrates the regional variations in the analyzed metric across the scalp for dataset 1 and dataset 2, respectively.
